## Proof of Individual Belief Convergence in a Weakly Connected Influence Graph Using Confirmation Bias Update

## Bernardo Amorim

bernardoamorim@dcc.ufmg.br

## May 2020

**Definition 1.** The confirmation-bias update-function, is defined as:

$$B^{t+1}(a_i|a_j) = B^t(a_i) + f_{cb}^t(a_i, a_j) \cdot I(a_j, a_i) (B^t(a_j) - B^t(a_i))$$
(1)

While  $f_{cb}^t(a_i, a_j)$  is defined as  $1 - |B^t(a_j) - B^t(a_i)|$ .

**Definition 2.** While the *overall confirmation-bias update*, is defined as:

$$B^{t+1}(a_i) = \frac{1}{|A|} \sum_{a_i \in A} B^{t+1}(a_i|a_j)$$
 (2)

**Definition 3.** We say a influence graph In over agents A is weakly connected if for all  $a_i$ ,  $a_j \in A$ , there exist  $a_{k_1}, a_{k_2}, ..., a_{k_l} \subseteq A$  such that  $I(a_i, a_{k_1}) > 0$ ,  $I(a_{k_l}, a_j) > 0$ , and for m = 1, ..., l-1,  $I(a_{k_m}, a_{k_{m+1}}) > 0$ .

**Definition 4.**  $max^t$  and  $min^t$  are the maximum and minimum belief values in a given instant t, respectively. Thus:

$$min^t = \min_{a_i \in A} B^t(a_i)$$
 and  $max^t = \max_{a_i \in A} B^t(a_i)$ .

To prove our conjecture, let's do some simplifications:

$$B^{t+1}(a_i) = \frac{1}{|A|} \sum_{a_j \in A} B^{t+1}(a_i | a_j).$$

$$= \frac{1}{|A|} \sum_{a_j \in A} \left( B^t(a_i) + f_{cb}^t(a_i, a_j) . I(a_j, a_i) (B^t(a_j) - B^t(a_i)) \right)$$

$$= B^t(a_i) + \frac{1}{|A|} \sum_{a_j \in A} f_{cb}^t(a_i, a_j) . I(a_j, a_i) (B^t(a_j) - B^t(a_i))$$
(3)

Since we have a finite number of beliefs and  $\forall a_i \in A : B^t(a_i) \in [0, 1]$ , there are always  $min^t$  and a  $max^t$ . We shall also note that, by the Squeeze Theorem, individual agent opinion converges to the same value if and only if  $lim_{t\to\infty} min^t = lim_{t\to\infty} max^t$ .

Since we want to prove that it always converges, if  $min^t = max^t$  we have nothing to prove, so assume from now on  $min^t \neq max^t$ . We will also assume from now on that no agent has belief 0 or 1, which will guarantee us that  $\forall t$  and  $\forall a_i, a_j \in A, f_{cb}^t(a_i, a_j) > 0$ . The case in which there are beliefs equal to 0 or 1 will be addressed later.

**Lemma 1.** In a weakly connected graph and under confirmation-bias belief update:

$$\forall t \ and \ \forall a_i \in A : min^t \leq B^{t+1}(a_i) \leq max^t$$

*Proof.* By the equation 3:

$$B^{t+1}(a_i) = B^t(a_i) + \frac{1}{|A|} \sum_{a_i \in A} f_{cb}^t(a_i, a_j) I(a_j, a_i) (B^t(a_j) - B^t(a_i))$$

Substituting  $B^t(a_j)$  by  $max^t$  turns our equation into an inequality, since  $\forall a_j \in A$ ,  $B^t(a_j) \leq max^t$  and also makes the terms inside the summation either equal to or smaller than 0. Thus:

$$B^{t+1}(a_{i}) \leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A} f_{cb}^{t}(a_{i}, a_{j}) . I(a_{j}, a_{i}) (max^{t} - B^{t}(a_{i}))$$

$$\leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A} f_{cb}^{t}(a_{i}, a_{j}) . (max^{t} - B^{t}(a_{i})) \qquad \text{(since } In(a_{j}, a_{i}) \leq 1 \text{ and }$$

$$max^{t} - B^{t}(a_{i}) \geq 0)$$

$$\leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A} (max^{t} - B^{t}(a_{i})) \qquad \text{(since } f_{cb}^{t}(a_{i}, a_{j}) \leq 1 \text{ and }$$

$$max^{t} - B^{t}(a_{i}) \geq 0)$$

$$= B^{t}(a_{i}) + \frac{|A|}{|A|} (max^{t} - B^{t}(a_{i}))$$

$$= B^{t}(a_{i}) + max^{t} - B^{t}(a_{i})$$

$$B^{t+1}(a_{i}) \leq max^{t} \qquad (4)$$

Since  $a_i$  was arbitrary, the Lemma is true for all agents. The same reasoning can be used to show the equivalent property for  $min^t$ 

**Corollary 1.** In a weakly connected influence graph under the confirmation-bias update function:

$$max^{t+1} \leq max^t$$
 and  $min^{t+1} \geq min^t$  for all  $t$ .

*Proof.* Lemma 1 tells us that all beliefs in the time t+1 are either smaller or equal to  $max^t$ . Since  $max^{t+1}$  must be one of those beliefs,  $max^{t+1} \leq max^t$ . The same reasoning can be used for  $min^t$ .

Corollary 2. 
$$\lim_{t\to\infty} \max^t = U$$
 and  $\lim_{t\to\infty} \min^t = L$  for some  $U, L \in [0,1]$ .

*Proof.* Both  $max^t$  and  $min^t$  are bounded between 0 and 1 and Lemma 1 showed us that they are monotonic. According to the Monotonic Convergence Theorem, this guarantees that the limits exist.

The proof will follow by showing that an agent  $a_i$  that holds some belief  $B^t(a_i)$  influences every other agent by the time t + |A| - 1. Before we do this, let's jump into some small definitions and corollaries that will help us on the way.

**Definition 5.** Let's call the sequence  $P(a_i \to a_j) = (a_i, a_k, ..., a_{k+l}, a_j)$  a simple path from  $a_i$  to  $a_j$ , if:

- All elements on the sequence are different.
- The first element in the sequence is  $a_i$ .
- The last element in the sequence is  $a_i$ .
- If  $a_n$  is the n'th element in the sequence, if it has a successor  $a_{n+1}$ ,  $I(a_n, a_{n+1}) > 0$ .

Many simple paths from  $a_i$  to  $a_j$  can exist, although our notation isn't enough to differentiate them. But in subsequent steps we will only need one of those simple paths, so the notation shouldn't be a problem.

**Definition 6.** Denote by  $|P(a_i \to a_j)|$  the *size* of a simple path from  $a_i$  to  $a_j$ , which we define as the number of elements in the sequence  $P(a_i \to a_j) - 1$ .

Corollary 3. 
$$\forall P(a_i \rightarrow a_j), |P(a_i \rightarrow a_j)| \leq |A| - 1.$$

*Proof.* A simple path doesn't have repeated elements and we have |A| agents, thus simple path can't have more than |A| elements. According to Definition 6, the size of a simple path is defined as the number of elements minus one, thus maximum size is |A| - 1.

**Lemma 2.**  $\forall x, \forall t \text{ and } \forall a_i, \text{ if } B^t(a_i) \leq x$ :

$$B^{t+1}(a_i) \le x + \frac{1}{|A|} \sum_{a_i \in A} f_{cb}^t(a_i, a_j).I(a_j, a_i) \left(B^t(a_j) - x\right)$$

Proof.

$$B^{t+1}(a_i) = \frac{1}{|A|} \sum_{a_j \in A} \left( B^t(a_i) + f_{cb}^t(a_i, a_j) . I(a_j, a_i) \left( B^t(a_j) - B^t(a_i) \right) \right)$$

$$= \frac{1}{|A|} \sum_{a_j \in A} \left( B^t(a_i) (1 - f_{cb}^t(a_i, a_j) . I(a_j, a_i)) + f_{cb}^t(a_i, a_j) . I(a_j, a_i) B^t(a_j) \right)$$

$$\leq \frac{1}{|A|} \sum_{a_j \in A} \left( x . (1 - f_{cb}^t(a_i, a_j) . I(a_j, a_i)) + f_{cb}^t(a_i, a_j) . I(a_j, a_i) B^t(a_j) \right)$$

$$= x + \frac{1}{|A|} \sum_{a_j \in A} f_{cb}^t(a_i, a_j) . I(a_j, a_i) \left( B^t(a_j) - x \right)$$

**Lemma 3.**  $\forall a_i, a_k \in A \text{ and } \forall n \geq 1 \text{ and } \forall t$ :

$$B^{t+n}(a_i) \le \max^t + \frac{1}{|A|} f_{cb}^{t+n-1}(a_i, a_j) . I(a_k, a_i) (B^{t+n-1}(a_k) - \max^t)$$
 (5)

3

*Proof.* By the Definitions 1 and 2:

$$B^{t+n}(a_i) = \frac{1}{|A|} \sum_{a_j \in A} B^{t+n}(a_i|a_j)$$

$$B^{t+n}(a_i) = \frac{1}{|A|} \sum_{a_j \in A} \left( B^{t+n-1}(a_i) + f_{cb}^{t+n-1}(a_i, a_j) . I(a_j, a_i) (B^{t+n-1}(a_j) - B^{t+n-1}(a_i)) \right)$$

According to Corollary 1:  $B^{t+n}(a_i) \leq max^{t+n} \leq max^{t+n-1}$ . Thus we can use Lemma 2:

$$B^{t+n}(a_i) \leq \frac{1}{|A|} \sum_{a_j \in A} \left( max^{t+n-1} + f_{cb}^{t+n-1}(a_i, a_j) . I(a_j, a_i) (B^{t+n-1}(a_j) - max^{t+n-1}) \right)$$

$$= max^{t+n-1} + \frac{1}{|A|} \sum_{a_i \in A} f_{cb}^{t+n-1}(a_i, a_j) . I(a_j, a_i) (B^{t+n-1}(a_j) - max^{t+n-1})$$

To make our Lemma useful in future manipulations, we will take an arbitrary element  $a_k$  out of the summation :

$$B^{t+n}(a_i) \leq \max^{t+n-1} + \frac{1}{|A|} \sum_{a_j \in A \setminus \{a_k\}} \left( f_{cb}^{t+n-1}(a_i, a_j) . I(a_j, a_i) (B^{t+n-1}(a_j) - \max^{t+n-1}) \right) + \frac{1}{|A|} f_{cb}^{t+n-1}(a_i, a_j) . I(a_k, a_i) (B^{t+n-1}(a_k) - \max^{t+n-1})$$

Since  $max^{t+n-1}$  is the greatest belief possible in that time step, the summation can be at most 0, thus:

$$B^{t+n}(a_i) \le \max^{t+n-1} + \frac{1}{|A|} f_{cb}^{t+n-1}(a_i, a_j) . I(a_k, a_i) \left( B^{t+n-1}(a_k) - \max^{t+n-1} \right)$$

Since max doesn't increase throughout time,  $max^{t+n-1} \leq max^t$ . Thus:

$$B^{t+n}(a_i) \le \max^t + \frac{1}{|A|} f_{cb}^{t+n-1}(a_i, a_j) . I(a_k, a_i) \left( B^{t+n-1}(a_k) - \max^t \right)$$

**Definition 7.** Denote by  $I_{min}$  the smallest positive influence in the influence graph.

**Definition 8.** Let's denote by  $f_{cbmin}$  the smallest  $f_{cb}$  in our society. Note that, this  $f_{cb}$  is greater than 0 because of our assumption that no agents have belief 0 or 1. Note, also, that the minimum  $f_{cb}$  occurs between  $max^0$  and  $min^0$ , does it does not diminishes throughout time, according to 1.

Using the same notation we used in Corollary 2, let's call  $\lim_{t\to\infty} \max^t = U$  and  $\lim_{t\to\infty} \min^t = L$ . Denoting by  $a_*^t$  one agent who holds the belief  $\min^t$  in the time t:

Theorem 1.  $\forall t \ and \ \forall a_i \in A$ :

$$B^{t+|P(a_*^t\to a_i)|}(a_i) \le max^t - \delta^t$$
, with  $\delta^t = \left(\frac{I_{min} \cdot f_{cbmin}}{|A|}\right)^{|P(a_*^t\to a_i)|} \cdot (U-L)$ .

*Proof.* By equation 3:

$$B^{t+|P(a_*^t \to a_i)|}(a_i) = Bel_p^{t+|P(a_*^t \to a_i)|-1}(a_i) + \frac{1}{|A|} \sum_{a_i \in A} B^{t+|P(a_*^t \to a_i)|-1}(a_i|a_j)$$

We will now separate, at each step, a carefully chosen element of the summation and apply Lemma 3 to modify our inequality. The chosen elements will be the ones in  $P(a_*^t \to a_i)$ , starting from the end of the simple path until we get to  $a_*^t$ .

To simplify the notation, let's index the elements in the simple path from  $a_*^t$  to  $a_i$ , starting from the end of the simple path (since we are backtracking) by calling  $a_n$  the  $n^{th}$  element from the end to the beginning of the sequence (excluding  $a_i$  itself).

By Lemma 3:

$$B^{t+|P(a_*^t\to a_i)|}(a_i) \leq \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a_*^t\to a_i)-1|}(a_i,a_1).I(a_1,a_i) (B^{t+|P(a_*^t\to a_i)-1|}(a_1) - \max^t)$$

If  $|P(a_*^t, a_i)| = 1$ , we could prove our result. Instead of showing it I will expand this two more times to show the general formula.

Using Lemma 3:

$$\begin{split} &B^{t+|P(a^t_*\to a_i)|}(a_i) \\ &\leq \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-1|}(a_i,a_1).I(a_1,a_i)(B^{t+|P(a^t_*\to a_i)-1|}(a_1) - \max^t) \\ &\leq \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-1|}(a_i,a_1).I(a_1,a_i) \times \\ &\left( \left( \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-2|}(a_1,a_2).I(a_2,a_1)(B^{t+|P(a^t_*\to a_i)-2|}(a_2) - \max^t) \right) - \max^t \right) \\ &= \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-1|}(a_i,a_1).I(a_1,a_i) \times \\ &\left( \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-2|}(a_1,a_2).I(a_2,a_1)(B^{t+|P(a^t_*\to a_i)-2|}(a_2) - \max^t) \right) \\ &= \max^t + \frac{1}{|A|^2} f_{cb}^{t+|P(a^t_*\to a_i)-1|}(a_i,a_1).f_{cb}^{t+|P(a^t_*\to a_i)-2|}(a_1,a_2).I(a_2,a_1)I(a_1,a_i) \times \\ &(B^{t+|P(a^t_*\to a_i)-2|}(a_2) - \max^t) \\ &\leq \max^t + \frac{1}{|A|^2} f_{cb}^{t+|P(a^t_*\to a_i)-1|}(a_i,a_1).f_{cb}^{t+|P(a^t_*\to a_i)-2|}(a_1,a_2).I(a_2,a_1)I(a_1,a_i) \times \\ &\left( \left( \max^t + \frac{1}{|A|} f_{cb}^{t+|P(a^t_*\to a_i)-3|}(a_2,a_3).I(a_3,a_2) \left( B^{t+|P(a^t_*\to a_i)-3|}(a_3) - \max^t \right) \right) - \max^t \right) \end{split}$$

$$= \max^{t} + \frac{1}{|A|^{2}} f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-1|}(a_{i}, a_{1}). f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-2|}(a_{1}, a_{2}). I(a_{2}, a_{1})I(a_{1}, a_{i}) \times$$

$$\left(\frac{1}{|A|} f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-3|}(a_{2}, a_{3}). I(a_{3}, a_{2}) \left(B^{t+|P(a_{*}^{t} \to a_{i})|-3}(a_{3})\right) - \max^{t}\right)$$

$$= \max^{t} + \frac{1}{|A|^{3}} f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-1|}(a_{i}, a_{1}). f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-2|}(a_{1}, a_{2}). f_{cb}^{t+|P(a_{*}^{t} \to a_{i})-3|}(a_{2}, a_{3}) \times$$

$$I(a_{3}, a_{2})I(a_{2}, a_{1})I(a_{1}, a_{i}) \left(B^{t+|P(a_{*}^{t} \to a_{i})|-3}(a_{3}) - \max^{t}\right)$$

We can see a pattern forming and this pattern will continue throughout time. Denoting  $P_{In}$  the product of the influences in the simple path  $(P_{In} = I(a_*^t, a_{|P(a_*^t, a_i)|}) \times ... \times I(a_1, a_i))$ , and denoting by  $F_{cb}$  the product of the  $f_{cb}$ 's we can write the general version of the inequality above as:

$$B^{t+|P(a_*^t \to a_i)|}(a_i) \le max^t + \frac{P_{In}.F_{cb}}{|A|^{|P(a_*^t \to a_i)|}} (Bel_p^t(a_*^t) - max^t)$$

$$= max^t + \frac{P_{In}.F_{cb}}{|A|^{|P(a_*^t \to a_i)|}} . (min^t - max^t)$$
(6)

The rightmost term in the equation is either equal to or smaller than 0 thus, to make the inequality hold for all  $a_i$ 's, we shall substitute  $P_{In}$  by the smallest value possible. By the Definition 7,  $I_{min}$  is the smallest positive influence in the graph and according to Definition 5 the influences in a simple path are positive. Thus:

$$B^{t+|P(a_*^t \to a_i)|}(a_i) \le max^t + \left(\frac{I_{min}}{|A|}\right)^{|P(a_*^t \to a_i)|} .F_{cb}.(min^t - max^t)$$

Using the same reasoning we must replace all  $f_{cb}$  by the smallest value they can assume, which is  $f_{cbmin}$ :

$$B^{t+|P(a_*^t \to a_i)|}(a_i) \le max^t + \left(\frac{I_{min}.f_{cbmin}}{|A|}\right)^{|P(a_*^t \to a_i)|}.(min^t - max^t)$$

According to Corollary 2, the maximum value of  $min^t$  is L and the minimum value of  $max^t$  is U, thus:

$$B^{t+|P(a_*^t \to a_i)|}(a_i) \le max^t + \left(\frac{I_{min} \cdot f_{cbmin}}{|A|}\right)^{|P(a_*^t \to a_i)|} \cdot (L - U)$$

$$\le max^t - \left(\frac{I_{min} \cdot f_{cbmin}}{|A|}\right)^{|P(a_*^t \to a_i)|} \cdot (U - L)$$

$$\le max^t - \delta^t$$

Lemma 4.

$$\sum_{a_j \in A} f_{cb}^t(a_i, a_j) . I(a_j, a_i) \left( B^t(a_j) - B^t(a_i) \right) = \sum_{a_j \in A \setminus \{a_i\}} f_{cb}^t(a_i, a_j) . I(a_j, a_i) \left( B^t(a_j) - B^t(a_i) \right)$$

Proof.

$$\sum_{a_{j} \in A} f_{cb}^{t}(a_{i}, a_{j}).I(a_{j}, a_{i}) \left(B^{t}(a_{j}) - B^{t}(a_{i})\right)$$

$$= \sum_{a_{j} \in A \setminus \{a_{i}\}} f_{cb}^{t}(a_{i}, a_{j}).I(a_{j}, a_{i}) \left(B^{t}(a_{j}) - B^{t}(a_{i})\right) + f_{cb}^{t}(a_{i}, a_{i}).I(a_{i}, a_{i})(B^{t}(a_{i}) - B^{t}(a_{i}))$$

$$= \sum_{a_{j} \in A \setminus \{a_{i}\}} f_{cb}^{t}(a_{i}, a_{j}).I(a_{j}, a_{i}) \left(B^{t}(a_{j}) - B^{t}(a_{i})\right)$$

**Lemma 5.** If  $B^{t+n}(a_i) \leq max^t - \gamma$ ,  $\gamma \geq 0$  and  $n \geq 0$ , then  $B^{t+n+1}(a_i) \leq max^t - \frac{\gamma}{|A|}$ .

Proof.

$$\begin{split} B^{t+n+1}(a_i) &= B^{t+n}(a_i) + \frac{1}{|A|} \sum_{a_j \in A} f_{cb}^{t+n}(a_i, a_j).I(a_j, a_i) \left( B^{t+n}(a_j) - B^{t+n}(a_i) \right) \\ &= B^{t+n}(a_i) + \frac{1}{|A|} \sum_{a_j \in A \backslash \{a_i\}} f_{cb}^{t+n}(a_i, a_j).I(a_j, a_i) \left( B^{t+n}(a_j) - B^{t+n}(a_i) \right) \quad \text{(Lemma 4)} \\ &\leq \max^t - \gamma + \frac{1}{|A|} \sum_{a_j \in A \backslash \{a_i\}} f_{cb}^{t+n}(a_i, a_j).I(a_j, a_i) \left( B^{t+n}(a_j) - \max^t + \gamma \right) \quad \text{(Lemma 2)} \\ &\leq \max^t - \gamma + \frac{1}{|A|} \sum_{a_j \in A \backslash \{a_i\}} f_{cb}^{t+n}(a_i, a_j).I(a_j, a_i) \left( \max^t - \max^t + \gamma \right) \\ &= \max^t - \gamma + \frac{1}{|A|} \sum_{a_j \in A \backslash \{a_i\}} f_{cb}^{t+n}(a_i, a_j).I(a_j, a_i) \left( \gamma \right) \\ &\leq \max^t - \gamma + \frac{1}{|A|} \sum_{a_j \in A \backslash \{a_i\}} (\gamma) \\ &= \max^t - \gamma + \frac{(|A| - 1)(\gamma)}{|A|} \\ &= \max^t + \frac{(\gamma)((-|A|) + (|A| - 1))}{|A|} \\ &= \max^t - \frac{\gamma}{|A|} \end{split}$$

**Theorem 2.**  $\forall a_i \in A: B^{t+|A|-1}(a_i) \leq max^t - \epsilon, \text{ with } \epsilon = \left(\frac{I_{min}.f_{cbmin}}{|A|}\right)^{|A|-1}.(U-L).$ 

*Proof.* Keeping the notation of Theorem 1, let's call  $a_*^t$  one agent that holds the belief  $min^t$  in the time t.

Note that, if  $|P(a_*^t \to a_i)| = |A| - 1$ , our theorem is true by Theorem 1 and we nothing to prove.

Else if  $|P(a_*^t \to a_i)| \neq |A| - 1$ , then  $|P(a_*^t \to a_i)| < |A| - 1$  according to Corollary 3.

According to Theorem 1:

$$B^{t+|P(a_*^t \to a_i)|}(a_i) \le max^t - \left(\frac{I_{min} \cdot f_{cbmin}}{|A|}\right)^{|P(a_*^t \to a_i)|} \cdot (U - L)$$

To keep things simple let's keep the notation from Theorem 1 and call:

$$\delta^t = \left(\frac{I_{min} \cdot f_{cbmin}}{|A|}\right)^{|P(a_*^t \to a_i)|} \cdot (U - L)$$

Now it is easy to see that we can apply Lemma 5 successively:

$$B^{t+|P(a_*^t \to a_i)|+1}(a_i) \le \max^t - \frac{\delta^t}{|A|}$$

$$\downarrow \downarrow$$

$$B^{t+|P(a_*^t \to a_i)|+2}(a_i) \le \max^t - \frac{\delta^t}{|A|^2}$$

$$\downarrow \downarrow$$

$$B^{t+|P(a_*^t \to a_i)|+3}(a_i) \le \max^t - \frac{\delta^t}{|A|^3}$$

If we do it  $|A| - |P(a_*^t \to a_i)| - 1$  times we get:

Corollary 4.  $max^{t+|A|-1} \leq max^t - \epsilon$ 

*Proof.* Since  $max^{t+|A|-1}$  is one of the beliefs in the time t+|A|-1 and, according to Theorem 2 all of them are smaller than  $max^t$  by a factor of at least  $\epsilon$ ,  $max^{t+|A|-1}$  must also be smaller than  $max^t$  by a factor of at least  $\epsilon$ .

Theorem 3.  $\lim_{t\to\infty} max^t = U = \lim_{t\to\infty} min^t = L$ 

*Proof.* Suppose, by contradiction, that  $U \neq L$ . Plugging this values into the  $\epsilon$  formula show us that  $\epsilon > 0$ .

Let's assume we did  $v = (|A| - 1)(\lceil \frac{1}{\epsilon} \rceil + 1)$  time steps after t = 0. Since  $\max$  diminishes by at least  $\epsilon$  at each |A| - 1 steps:

$$max^0 \ge max^v + \epsilon \left( \left\lceil \frac{1}{\epsilon} \right\rceil + 1 \right)$$

Since  $\epsilon$ .  $\left(\left\lceil \frac{1}{\epsilon}\right\rceil + 1\right) > 1$  and  $0 \le max^v \le 1$ , this would imply that  $max^0 \ge 1$  contradicting the definition of belief!

Since assuming that  $U \neq L$  led us to a contradiction: U = L.

Theorem 4. 
$$\forall a_i, a_j \in A, \lim_{t \to \infty} B^t(a_i) = \lim_{t \to \infty} B^t(a_j)$$

*Proof.* Since 
$$L \leq \lim_{t \to \infty} B^t(a_i) \leq U$$
 and  $L = U$ :  $L = B^t(a_i) = U$ . And the same can be showed for  $B^t(a_i)$ .

Everything showed above was based on assumption that  $f_{cb} > 0$ , but this is not always true.  $f_{cb}$  can equal 0 when we have agents with belief 0 and 1 in the same graph.

Note that those beliefs are always maximum and minimum thus, according to Corollary 1 if in the time t no agent has belief 0 or belief 1, there will never be an agent with those beliefs in subsequent steps.

We will address this situation in two cases:

- Case 1:  $\forall a_i \in A : B^0(a_i) = 0$  or  $B^0(a_i) = 1$ . In this case our graph converges trivially (but necessarily to the same value), because every agent is not influenced by an agent that has a different belief, thus this graph is constant throughout time.
- Case 2:  $\exists a_{**} \in A$ ,  $B^0(a_{**}) \neq 0$  and  $B^0(a_{**}) \neq 1$ . From this situation we can reach the general case, in which  $f_{cb} > 0$ . The idea to prove this is similar to the one used in Theorem 1. Using  $a_{**}$  to influence every agent we can guarantee that no agent will have belief 0 or 1:

Lemma 6.  $\forall a_i \in A, \forall t$ :

If 
$$0 < B^t(a_i) < 1$$
, then  $0 < B^{t+1}(a_i) < 1$ .

*Proof.* By Equation 3 and Lemma 4:

$$B^{t+1}(a_i) = B^t(a_i) + \frac{1}{|A|} \sum_{a_i \in A} f_{cb}^t(a_i, a_j) . I(a_j, a_i) (B^t(a_j) - B^t(a_i))$$

$$= B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A \setminus a_{i}} f_{cb}^{t}(a_{i}, a_{j}) . I(a_{j}, a_{i}) (B^{t}(a_{j}) - B^{t}(a_{i}))$$

$$\leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A \setminus a_{i}} f_{cb}^{t}(a_{i}, a_{j}) . I(a_{j}, a_{i}) (1 - B^{t}(a_{i}))$$

$$\leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A \setminus a_{i}} f_{cb}^{t}(a_{i}, a_{j}) . (1 - B^{t}(a_{i}))$$

$$\leq B^{t}(a_{i}) + \frac{1}{|A|} \sum_{a_{j} \in A \setminus a_{i}} (1 - B^{t}(a_{i}))$$

$$= B^{t}(a_{i}) + \frac{(|A| - 1) . (1 - B^{t}(a_{i}))}{|A|}$$

$$= \frac{|A| . B^{t}(a_{i}) + (|A| - 1) . (1 - B^{t}(a_{i}))}{|A|}$$

$$= \frac{B^{t}(a_{i}) (|A| - (|A| - 1)) + (|A| - 1)}{|A|}$$

$$= \frac{B^{t}(a_{i}) + (|A| - 1)}{|A|}$$

$$= 1 + \frac{B^{t}(a_{i}) - 1}{|A|}$$

$$(7)$$

Since  $B^t(a_i) < 1$ ,  $\frac{B^t(a_i)-1}{|A|} < 0$ . Thus  $B^{t+1}(a_i) < 1$  as we wanted to prove. The same can be done to show that  $0 < B^t(a_i)$ .

Now it gets easy to see that we will fall on the general case:

In the time t = 1  $a_{**}$  influences all agents  $a_j$  in which  $|P(a_{**} \to a_j)| = 1$  this makes so that  $\forall t > 0, 0 < B^t(a_j) < 1$ , according to Lemma 6.

We can now use those  $a_j$ 's from previous step to influence the more agents out of the extremes. It isn't hard to see that, doing this repeatedly guarantees that, after |A|-1 steps every belief is different from 0 and 1. we then fall on the general case, which have already proved convergence for.
